

IPv6 Firewall Protocol Tests

Oliver Eggert, Simon Kiertscher

Outline

- Motivation
- Firewall Tests
 - e.g. Overlapping IPv6 Fragments
 - PadN Covert Channel
- FT6 (Firewalltester for IPv6) the new tool
- Test Setup & Test Results
 - Cisco ASA5510
 - IPTables
 - Juniper J2320
 - Checkpoint 2210 Appliance

Motivation

 What are current RFC requirements for firewalls?

How can you test your firewall in an easy way?

Can "IPv6 Ready" hardware keep its promise?

Firewall Tests

ICMPv6 filtering

- ICMPv6 is like ICMP for sharing information or error messages
- ICMPv6 also for Neighbor Discovery Protocol (NDP)
- According to RFC 4890 we made a list of packets which
 - should be dropped
 - are optional
 - must not be dropped

ICMPv6 filtering

Non-Filtered messages according to RFC4890

ICMPv6 Type	Description	
1	Destination Unreachable	
2	Packet Too Big	
3, Code 0	Time Exceeded*	
4, Code 1 and 2	Parameter Problem	
128, 129	Echo Request/Reply	

^{*}Marc Heuse recommends to drop it (c't article)

ICMPv6 filtering

Optional Filter List

ICMPv6 Type	Description
3, Code 1	Time Exceeded
4, Code 0	Parameter Problem
144, 145, 146, 147	IPv6 Mobility
150	Seamoby Experimental
5-99, 102-126	Unallocated Error Messages
154-199, 202-254	Unallocated Informational Messages

• The rest should be filtered!

Routing Header (RH)

- Especially RH0 (deprecated since Dec 2007 according to RFC 5095)
 - > treat it like an unknown RH
- Mobility Routing Header (RH 2) RFC 3775

RH Type	Segments left field	Behavior
RH 0	≠ 0	Drop
RH 0	= 0	Forward (ignore header)
RH 2	≠ 1	Drop
RH 2	= 1	Forward
RH 200	≠ 0	Drop
RH 200	= 0	Forward (ignore header)

IPv6 Header Chain Inspection

- There are 3 basic rules (RFC2460) that govern the order and occurrence of extension headers (header chain)
 - 1. Destination Options (DSTOPT) header at most twice (once before a Routing header and once before the upper-layer header)
 - 2. All other extension headers should occur at most once
 - The Hop-by-Hop (HBH) Options header is restricted to appear only immediately after the base IPv6 header

IPv6 Header Chain Inspection

• We test 7 different Header Chains

Header Chain	Validity
DSTOPT	Valid
DSTOPT, DSTOPT	Invalid
DSTOPT, RH, DSTOPT	Valid
НВН	Valid
HBH, HBH	Invalid
DSTOPT, HBH	Invalid
HBH, DSTOPT, RH, HBH	Invalid

- Overlapping IPv6 fragments are very dangerous if processed
- RFC 5722 (Handling of Overlapping IPv6
 Fragments) describes inter alia a fragmentation attack and expected node behavior

Fragment appearance	Behavior
Fragmented packet without overlap	Forward
Overlapping, rewriting the upper layer protocol header	Drop
Overlapping, rewriting the payload	Drop

```
IPv6 fragment (nxt=UDP (17) off=0 id=0x532fbc21)
                                         Source port: krb524 Destination port: ssh

```

Tiny IPv6 Fragments

- A Tiny-Fragment is a fragmented IPv6 packet where the upper-layer-header is located in the second fragment
- Firewall has to inspect the second fragment

Tiny Fragment appearance	Behavior
Upper-layer-header with allowed port number	Forward
Upper-layer-header with forbidden port number	Drop

Tiny IPv6 Fragments

 According RFC 2460 a device has to discard a packed if not all fragments have arrived within 60 seconds after the arrival of the first fragment

Tiny Fragment appearance	Behavior
Send the last fragment after 60 seconds	Forward
Send the last fragment after 61 seconds	Drop

Excessive Hop-by-Hop and Destination Option Options

- As specified in RFC 4942, every option should occur at most once, except Pad1 and PadN
- All HBH options have to be processed on every node they pass

excessive use \rightarrow denial-of-service attack

Options Profile

Jumbo Payload, PadN, Jumbo Payload

Router Alert, Pad1, Router Alert

Quick Start, Tunnel Encapsulation Limit, PadN, Quick Start

RPL Option, PadN, RPL Option

PadN Covert Channel

- PadN and Pad1 are used to align options to a multiple of 8 bytes
- Required for DSTOPT and HBH header
- Valid payload of PadN must only contains zeroes
- What if not?
 - → Abuse as a covert channel

Header	PadN Behavior		
НВН	Valid	Forward	
НВН	Invalid	Drop	
DSTOPT	Valid	Forward	
DSTOPT	Invalid	Drop	

Address Scopes

- A firewall must not forward packets with a wrong scope address
- The test contains a mix of different
 - Multicast addresses
 - Link-local addresses

Scope	Address range		
Multicast	ff00::/32 - ffff::/32		
Link-Local	fe80::/16 - febf::/16		

FT6 the new tool

Test Setup & Test Results

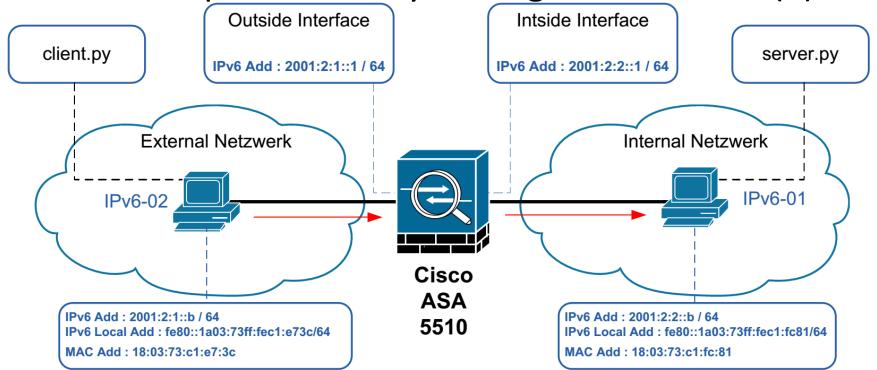

Firewalls

- 1. Cisco ASA5510
- 2. IPTables
- 3. Juniper J2320
- 4. Checkpoint 2210 Appliance

Setup for Cisco ASA5510

- Linux grml 3.7.1-grml-amd64 Debian 3.7.9 + grml.1 x86_64 (uname -a)
- Cisco ASA Software Release Version 9.0(2) with Cisco Adaptive Security Manager Version 7.1(2).

Setup

- Webserver use case → only port 80 is open
- First test with basic setup (out-of-the-box)
- Second test, try to fulfill the requirements
 - Adding rules
 - Activating IPS

Test Results ASA5510

Test	Basic Rules		Advanced Rules / IPS	
ICMPv6 Filtering	*	-		
Routing Header	*	-	"segments left" not filterable	
Header Chain	*		*	
Overlapping Fragments	◇			
Tiny IPv6 Fragments A	◇			
Tiny IPv6 Fragments B	*			
Excessive HBH Options	-	+	+	
PadN Covert Channel	* -	+	+	
Address Scope	◇			

- 100% Drop + 100% Forward

ICMPv6 Filtering

- Despite explicit forward rule
- Dropped:
 - Type 1, Destination Unreachable
 - Type 2, Packet Too Big
 - Type 3, Code 0, Time Exceeded
 - Type 4, Code 1 & 2, Parameter Problem

answers to a former packed but no former package was received
